AMP H5: review delivery / submission decision

12 October 2026 — journal-policy correction v2

GO for substantive human review; NO_GO for journal submission.

Supported result. In one development setting, CE21 improves reconstruction and all six generation distances versus matched MSE21, while the executed terminal LSTM has lower distances still. Novelty, broader superiority and biological efficacy are not established.

Open gate	Required evidence or action
Science	Establish a distinct contribution, adequate baseline comparison and independent confirmation. Single-seed, reused-development results remain insufficient.
Bioinformatics AI	NOT COMPLIANT: the journal-specific ISCB policy prohibits LLM drafting of paper sections. This manuscript involved substantive AI drafting. General OUP disclosure rules do not override this restriction; disclosure or a responsibility sentence cannot cure it. No AI rewrite will be labelled human-written.
Format	Original Papers: 7 journal-template pages; format-free initial submission guidance: approximately 5,000 words. The current 16-page, double-spaced review layout is not a 16-page journal allowance or proof of template compliance.
Reproducibility	Resolve usable data/code/weight access, licensing, baseline adequacy and interrupted-attempt provenance. A private Library copy is not a public reproducibility release.
Authorship	Hongsheng Wang is confirmed as first author by the user. Other authors' consent/order, affiliations, corresponding-author authorization, individual contributions, funding, conflicts and final approval remain unverified.
Historical biology	Any efficacy claim would require verified generation-to-selection-to-assay links, MIC rules, N meaning, replicate identities and aggregation. The present candidate makes no such claim.

Actual AI use. Codex assistants contributed code, orchestration, evidence checks, literature retrieval, substantive manuscript drafting, LaTeX and deterministic data-plotting code. AI-agent checks are not human peer review. Complete historical model/version records and actual human verification remain unresolved.

Communications Biology. Its current AI framework permits extensive writing support only with demonstrable human oversight, verification and disclosure. Current records do not establish those conditions. A novel, significant contribution is also unproven. Changing journal does not remove either limitation; NO_GO remains.

Version scope. Only this decision and guideline/policy records are corrected. The audited main manuscript, supplement and Overleaf source remain unchanged and traceable. Earlier policy uncertainty is superseded by this explicit non-compliance finding.

Preserved boundaries. No new training or sampling, no reserved-test access, no edits to H0–H4 or the original manuscript. Publication decisions remain with the human authors and journal.
